

THE BLACK DATA OF PIEMONTE

Visualization of the distribution and evolution of fatal car accidents from 1997 to 2011 in Piemonte (Italy)

The visualization shows how many fatal car accidents occur in each province and district of Piemonte region. One of the most unexpected thing is that, statistically speaking, women are better drivers than men: women have much more chances

not to have a fatal accident than men. Another thing that can be infer from data is an overall decreasing trend in the number of fatal accidents. It's probably due to safer vehicles on the road and increased awareness of drivers.

* DISTRICT CONSIDERED: more than 10 deaths in 15 years
